

Wire Terminals

Wire terminals play a vital role connecting the UV lamp to the high voltage power supply. The high voltage, high heat nature of UV system components require all connectors be tightly secured. Periodically check for looseness. About 15% of lamp failures can be attributed to burning and arcing at the wire terminal. **Do not use terminals purchased at your local hardware store!** TCS Technologies uses only nickel terminals with a 1200 degree temperature rating.

The most common type of terminals are:
